# **Predictive Maintenance Project**

## **– Sorbonne Data Analytics**

Ibrahim Guoual Belhamidi

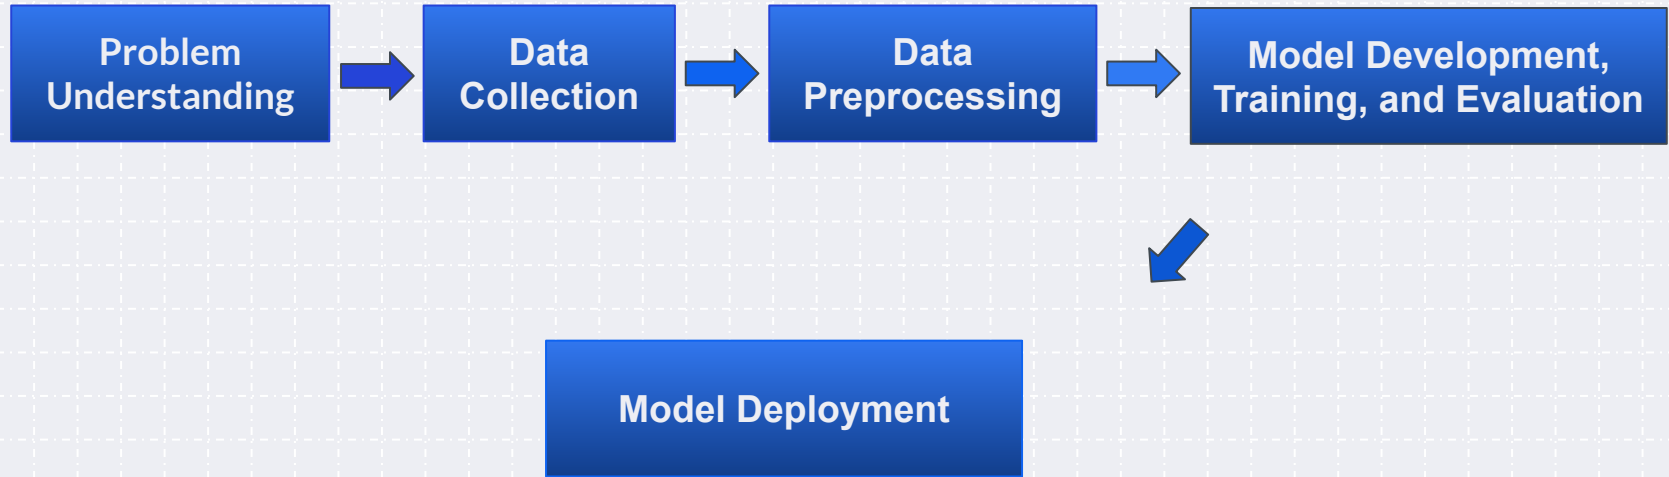

# Problematic

In a factory with over 100 CNC machines, wear and tear are inevitable, leading to occasional failures that result in repair costs and production downtime. It's not economically feasible to have a technician check each machine's health after every operation.

The goal is to automate this process by creating an end-to-end solution that alerts the repair team to potential issues before a machine breaks down.

# Timeline:

# About Dataset:

Given the The dataset contains 10,000 rows with 10 features:

- **UID:** Unique identifier (1-10,000)
- **ProductID:** Includes a quality variant (L, M, H) and a serial number.
- **Air temperature [K]:** Random walk process, normalized to 2 K around 300 K.
- **Process temperature [K]:** Air temperature plus 10 K, normalized to 1 K.
- **Rotational speed [rpm]:** Based on 2860 W power with noise.
- **Torque [Nm]:** Normally distributed around 40 Nm ( $\sigma = 10$  Nm).
- **Tool wear [min]:** Quality variants (H/M/L) add 5/3/2 minutes of tool wear.
- **Machine failure:** Indicates if a machine failure occurred for any failure mode.
- **Target:** Failure or Not.
- **Failure Type:** Type of Failure.

9661 (96.61%) of total machine working in the dataset

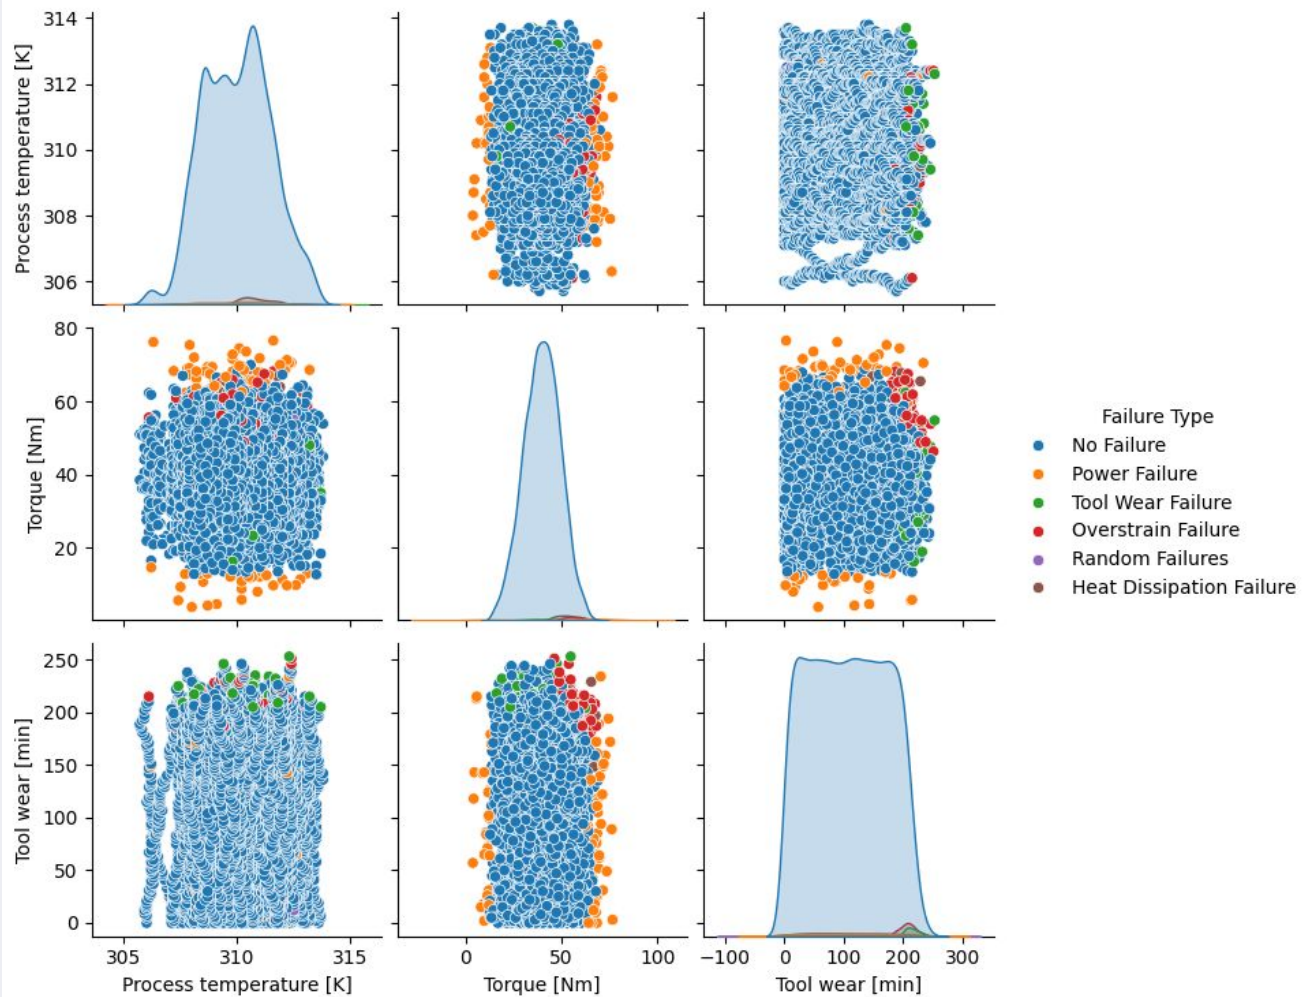

**339 (03.39%)**

of the total machine experienced failure in the dataset

**9661 (96.61%)**

Of total machine working in the dataset

# Models used and their result:

In this case, we used multiple ML models.

- GradientBoostingClassifier.
- RandomForestClassifier.
- RandomForestClassifier with Class Weight Adjustment (Auto).
- RandomForestClassifier with Combining Oversampling and Undersampling.
- CatBoostClassifier with Class Weight Adjustment.
- CatBoostClassifier Combining Oversampling and Undersampling.
- Neural network model.
- Neural network model with Resampling.
- Neural network model with customasition.

# Models used and their result:

GradientBoostingClassifier.

In this case, This Model Scored 85%.

# Models used and their result:

RandomForestClassifier.

In this case, This Model Scored 89.09%.

# Models used and their result:

RandomForestClassifier with Class Weight Adjustment (Auto).

In this case, This Model Scored 90.24%.

# Models used and their result:

RandomForestClassifier with Combining  
Oversampling and Undersampling

In this case, This Model Scored 90.31%.

# Models used and their result:

## CatBoostClassifier with Class Weight Adjustment

In this case, This Model Scored 86.78%.

# Models used and their result:

CatBoostClassifier Combining  
Oversampling and Undersampling

In this case, This Model Scored 90%.

# Models used and their result:

## Neural network model

In this case, This Model Scored 89.40%.

# Models used and their result:

Neural network model using  
Dropout(0.5) to reduce overfitting and  
Early Stopping.

In this case, This Model Scored 90.39%.

# ML models comparison and showing the best model:

In our case, a perfect model is one that has 0 false negatives (i.e., all actual failures are predicted correctly) and the minimum possible number of false positives (i.e., the fewest incorrect predictions of failure among actual working cases), as presented.

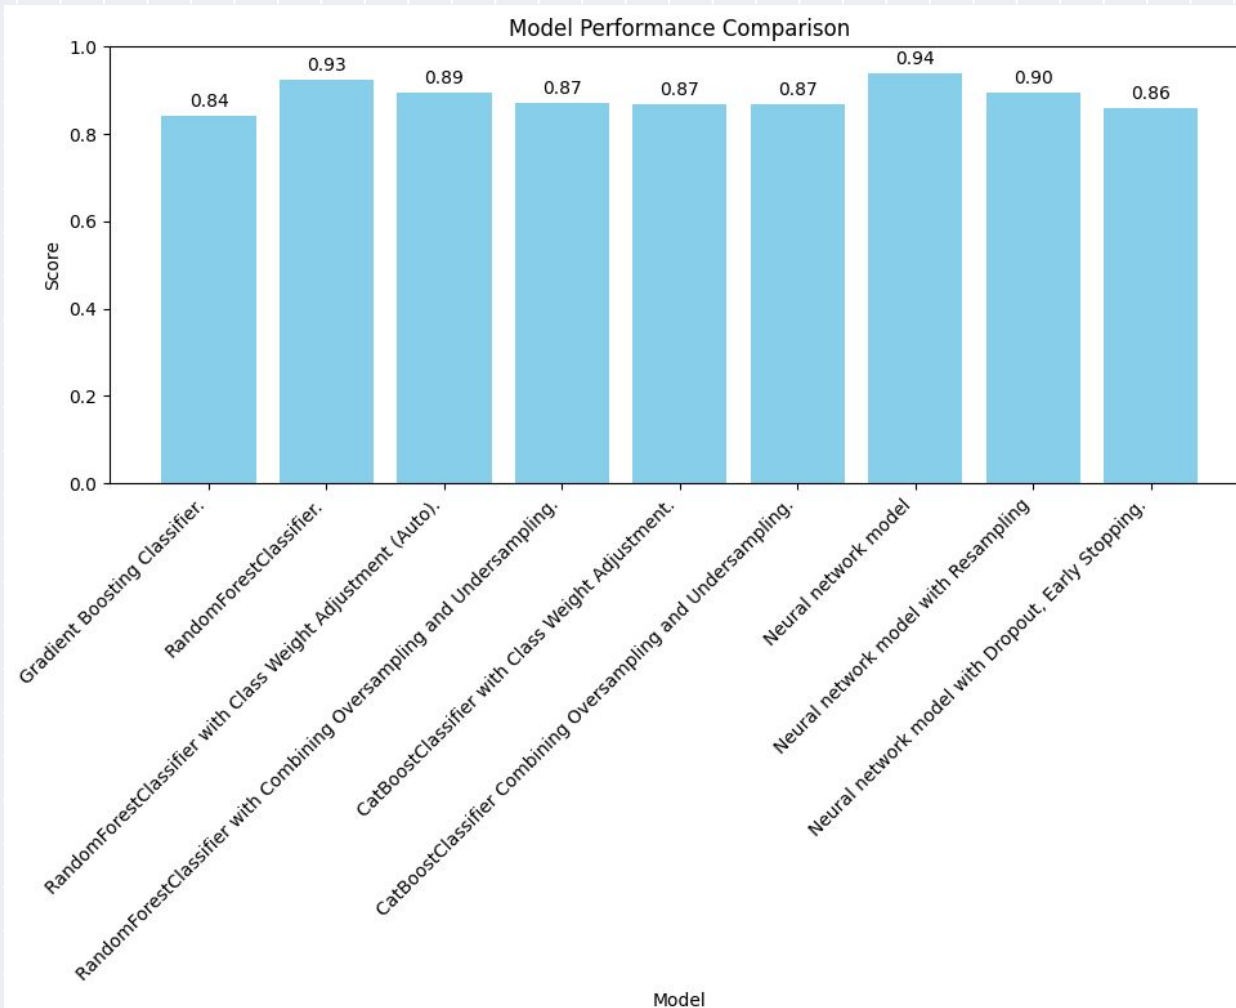

# ML models comparison and showing the best model:

since in our case, a perfect model is a model that has 0 (False Negatives) and the minimum possible of FP (False Positives), we calculate our score based on this formula:

$$\text{Score} = \frac{(TN + TP)}{(TN + TP + \alpha \times FP + \beta \times FN)}$$

Where:

- TN (True Negatives): Actual Working and Predicted Working.
- TP (True Positives): Actual Failure and Predicted Failure.
- FP (False Positives): Actual Working and Predicted Failure.
- FN (False Negatives): Actual Failure and Predicted Working.

# suggested solution

We have created a solution that alerts the maintenance team if our machine learning model detects a potential issue with a specific machine. The interface will allow administrators to add contact information for their employees.

Additionally, we have developed a backend solution that sends notifications to the maintenance team via email.

While this solution is not intended to replace employees, it is designed to optimize their time by identifying potential failures for service and repair alongside regular maintenance."

## Email And Contact Alert For Maintenance

# suggested solution

The email will be received by an employee,  
alerting him of the potential failure and  
alerting him with the machine ID
